

Dashboard drawing before the feedback:

Feedback from Group Guinea Pigs:

1. Visualizations seem a bit bundled, spread out more.
2. Make sure maps are big enough to absorb the content in them.
3. Create a new column that adjusts for male and female population differences.
4. Create a new column that adjusts for age category differences.
5. Create a new column that adjusts for race category differences.

Feedback from Group Team Rocket (more of a comment rather than feedback):

1. Maybe we can incorporate another key value to summarize the data.

What we did not include:

In Group Guinea Pigs, we got the suggestion of creating new columns that adjust for the differences within the gender, age, and race categories so we level out the data and compare the categories within each of these different groups by the same percentage. However, after pondering on this, our group came to the conclusion that this will not be necessary for our dashboard. The reason for this is because we don't need to adjust for the differences within these categories to be able to find the answers that we need from the data. At this point, that would simply be a matter of preference in adjusting our data, rather than necessary steps to improve the overall results of our data. Because this does not in any way improve the results or understanding of our data, we made the decision to not include this feedback within our final drawing of our

dashboard. Every other piece of feedback was incorporated within the final version dashboard which can be seen below:
